UNIVERSITY HEALTH

4502 MEDICAL DRIVE, SAN ANTONIO, TX 78229

PH: 210-358-8532

PROCEDURE(S): CT ABDOMEN PELVIS W IV CONTRAST

ACCESSION(S): UH5834454

DATE OF EXAM: 1/23/2026 3:34 AM

REFERRING PHYSICIAN: MERIDYTH H BUSCHARDT

EXAM: CT abdomen and pelvis with contrast.

HISTORY: Patient is a 60 years old Female. Non-small cell lung cancer, staging
Metastatic disease evaluation

TECHNIQUE: Helically acquired CT images of the abdomen and pelvis were obtained after
IV contrast administration. Axial, coronal and sagittal reformats were obtained.

CONTRAST: 80 mL 350 mg/ml Omnipaque IV

COMPARISONS: CT abdomen dated 10/15/2025

FINDINGS:

GI SYSTEM:

Liver: Liver is normal in size and morphology. The portal venous system is
unremarkable. Redemonstrated, unchanged, 2 cm right lobe simple cyst.

Gallbladder and biliary tree: Contracted gallbladder with tiny calcific densities
within.

Pancreas: Focal hypodensity measuring 4 x 3 cm without mass effect/duct dilatation in
the pancreatic head, uncinate process.

Spleen: Spleen is normal in size. No focal lesions are seen.

GI Tract: The visualized esophagus and stomach are unremarkable. The small bowel is
unremarkable. Uncomplicated colonic diverticulosis. The appendix is visualized and is
normal. No free fluid, free air, or mesenteric stranding are seen.

GU SYSTEM:

Kidneys and ureters: The kidneys are normal in size without calculi or hydronephrosis.

The ureters are normal in caliber without stones. Single, 8 mm hypoenhancing cystic lesion right kidney interpolar region, too small for further characterization, likely simple cyst.

Adrenal glands: The adrenal glands are normal without focal lesions.

Urinary Bladder: The urinary bladder is decompressed.

Lymph Nodes: No significant mesenteric/retroperitoneal lymphadenopathy is identified.

Pelvis: Enlarged uterus with fibroids. No suspicious adnexal mass.

VASCULAR: The aorta and its major abdominal branches are unremarkable. The inferior vena cava and its tributaries are unremarkable.

SOFT TISSUES AND BONES: No suspicious osseous lesions or acute fractures are seen. Unchanged irregularity superior endplate L3 vertebral body. Visualized muscles and soft tissues are unremarkable.

LUNG BASES: Consolidative opacities right lung base with minimal pleural effusion. The visualized cardiac structures are unremarkable.

IMPRESSION:

1. Focal hypodensity without mass effect/duct dilatation in the pancreatic head, uncinate process, likely focal fat. Recommend further evaluation with MRI in the context of known primary malignancy.
2. Tiny calcific foci in the gallbladder, likely calculi. Recommend sonography.
3. Consolidative opacities right lung base with minimal pleural effusion.
4. Redemonstrated, unchanged superior endplate irregularity at L3 vertebral body.

I, Apurva Bonde, have personally interpreted the image(s) and dictated this examination or I have reviewed the image(s) as well as the residents interpretation and agree with the interpretation.
