UNIVERSITY HEALTH
4502 MEDICAL DRIVE, SAN ANTONIO, TX 78229
PH: 210-358-8532

PROCEDURE(S): CT CHEST W IV CONTRAST
ACCESSION(S): UH5834453
DATE OF EXAM: 1/23/2026 3:34 AM
REFERRING PHYSICIAN: MERIDYTH H BUSCHARDT

EXAM: CT chest with contrast

HISTORY: Non-small cell lung cancer, staging
Non-small cell lung cancer (NSCLC), metastatic, assess treatment response

TECHNIQUE: Following IV injection of iodine contrast, multislice helical CT of the chest was performed from the thoracic inlet to the upper abdomen. Images were reformatted into the axial, sagittal and coronal planes. Spectral analysis was not performed.

CONTRAST: 80 mL 350 mg/ml Omnipaque IV

COMPARISONS: None

FINDINGS:
Thoracic inlet: The visualized thyroid gland is unremarkable. No pathologically enlarged supraclavicular or axillary lymphadenopathy noted.

Mediastinum/Hila: No mediastinal mass or abnormally enlarged lymph nodes.

Great vessels: Normal caliber of the aorta and pulmonary artery. No evidence of pulmonary embolism on this nondedicated scan.

Lung parenchyma/pleura: The lung volumes are mildly decreased. There is evidence of a small right sided pleural effusion with similar opacity / atelectatic changes involving a basilar segment of the right lower lobe. This is associated with rightward tracheal and mediastinal shift. No left pleural effusion. No pneumothorax.

Small left subpleural nodule measuring up to 4 mm (201:28).

Trachea and airways: Rightward shift of the trachea with bronchial wall thickening involving the right lower lobe subsegmental bronchi.

Heart and pericardium: Rightward shift of the cardiomediastinal structures. Otherwise the visualized cardiac chambers are within normal limits.

Chest wall: Sclerotic focus in the posterior T3 vertebral body, measuring up to 9 mm. Chronic appearing compression fracture of the superior endplate of the T9 vertebral body with diffusely increased density. Small sclerotic focus in the left lateral third rib. The visualized chest wall soft tissues are unremarkable.

Upper abdomen: Please see dedicated report from CT abdomen of the same date for full findings below the diaphragm

IMPRESSION:

1. Findings consistent with opacity, likely collapse of a basilar segment of the right lower lobe with associated rightward tracheal and mediastinal shift. Small right-sided pleural effusion.
2. Small left subpleural nodule measuring up to 4 mm. Follow-up as clinically indicated.
3. Sclerotic focus in the posterior T3 vertebral body, measuring up to 9 mm. and chronic appearing compression fracture of the superior endplate of the T9 vertebral body with diffusely increased density. Correlate with recent dedicated MRI.
4. Please see dedicated report from CT abdomen of the same date for full findings below the diaphragm

I, Carlos S Restrepo, have personally interpreted the image(s) and dictated this examination or I have reviewed the image(s) as well as the residents interpretation and agree with the interpretation.
